

Tweaking Class Model Verification with Specialized Association Bounds

or

Once again on Association, Aggregation and Composition

Martin Gogolla

Starting point: a reflexive, binary association,

i.e., an association on a single class with two arms;

how can the association be populated with links?

how many links is a model finder allowed to build in the case of plain association, aggregation and composition?

our view: UML 1 understanding with the three association kinds being different; UML 2 does not distinguish between association and aggregation

Object model (system state) with n objects given.

Composition: at most $n-1$ links

$$4-1 = 3$$

tree-like (each node at most 1 root)

Aggregation: at most

$$n-1 + n-2 + \dots + 2 + 1 = n-1 * (n-2) / 2 \text{ links}$$

$$3+2+1 = 6$$

dag-like (directed, acyclic graph)

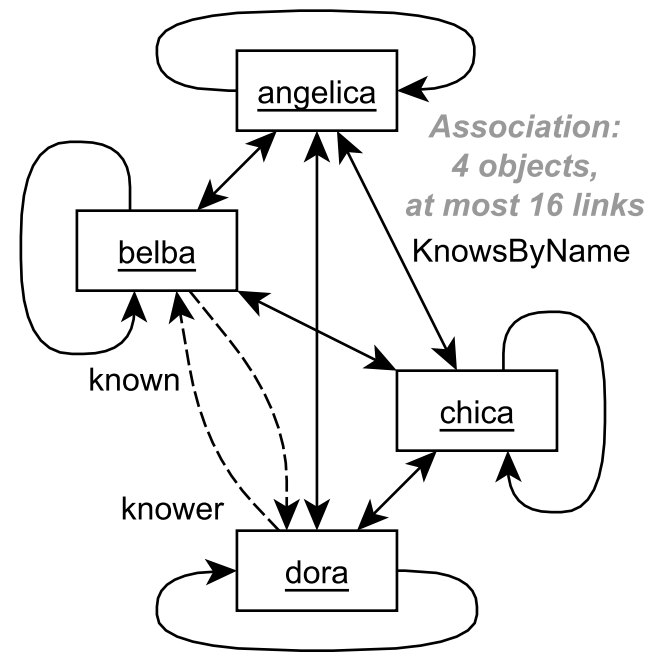

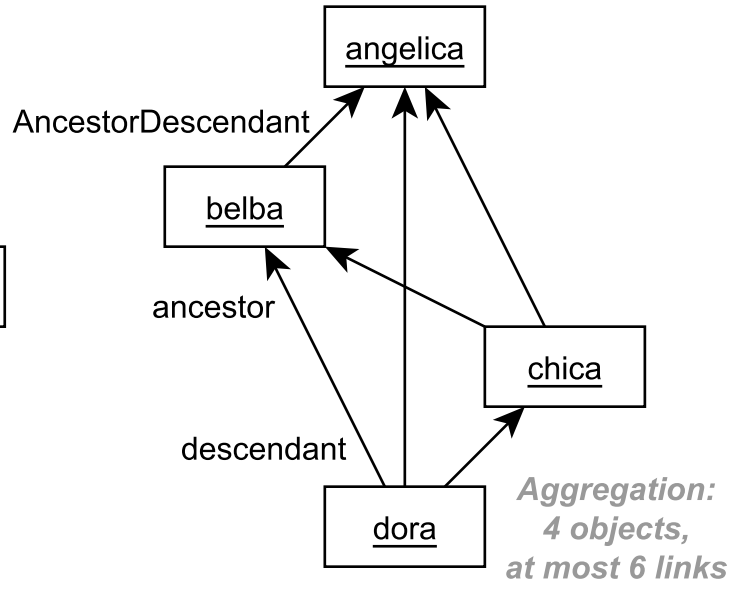

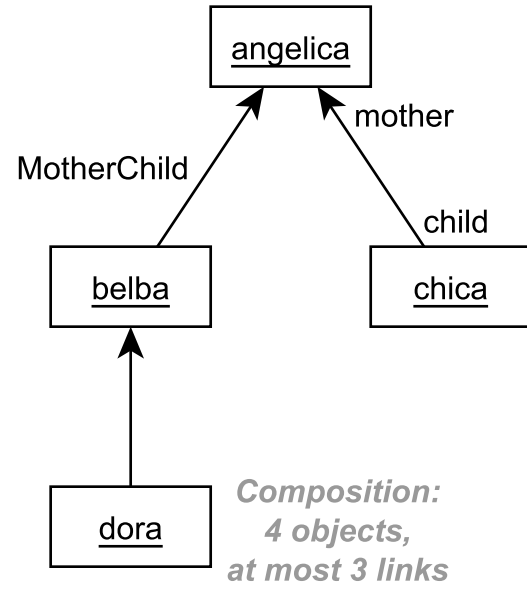

Association: at most $n * n$ links

$$4*4 = 16$$

graph-like
